## PREFACE

THIS book is designed to cover the work in arithmetic usually given to pupils during the fifth and sixth years of their school course.

It begins with a brief but comprehensive review of the work of the first four years, preparing the pupils to enter upon the study of the new topics with intelligence and ease. Reviews in various forms are, indeed, a feature of the book. The second part, like the first, begins with a thorough review of everything that has preceded, and each part ends with a series of industrial problems designed to apply in the most varied form the principles that have been taught. In addition to these general reviews, each advanced step in any topic is preceded by a brief résumé of the concepts already acquired, so that the pupil may attain and retain a comprehensive grasp of the whole.

The exercises, both oral and written, have been carefully graded, making the advance from one step to the next easy and natural. They are so numerous and varied that the pupils can not fail to become thoroughly familiar with numbers and with the practical processes of computation.

The problems have been framed with the greatest care. They are not numerical puzzles, nor are they based on unreal

conditions. They have been made both rational and practical, and they relate to a wide range of subjects drawn from modern life and industries. The information they embody has been gathered from reliable sources. The prime object of the book, however, is not to convey information on extraneous topics, but to teach the processes of arithmetic in the best way possible.

Great care has been expended on the method of presenting the various principles and on the solutions, with the aim of making them in the highest degree clear, concise, accurate, and practical.

Acknowledgment is made to Mr. J. D. Buchanan, of the Provincial Normal School, Vancouver, B.C., for valuable assistance in preparing this edition.

## NOTATION AND NUMERATION

7. The people of Europe first learned the use of the figures **1, 2, 3, 4, 5, 6, 7, 8, 9,** and **0** from the Arabs.

These ten figures are therefore called the **Arabic numerals**.

8. The method of representing numbers by means of the ten Arabic numerals is called the **Arabic notation**.

9. Any method of naming or reading numbers is called **numeration**.

10. 1. Count by ones to 9; by tens to 90; by hundreds to 900; by thousands to 9000.

2. Ones are called **units of the first order** or simply **units**; tens are called **units of the second order**; hundreds are called **units of the third order**; and so on.

11. In the Arabic notation :

(1) *The greatest number of units of any order is nine.*

(2) *Therefore ten units of any order are written as one unit of the next higher order.*

The Arabic notation, being based on the number ten, is often called the **decimal notation**, from the Latin word *decem*, meaning ten.

12. 1. Read : 8, 28, 46, 104, 208, 500, 987, 1000.

If you have read the numbers correctly, you have illustrated these three facts about reading numbers :

(1) *The figure 0 is not read.*

(2) *The word "and" is not used in reading integers.*

(3) *Tens and units and also hundreds, tens, and units are read together, as units.*

Thus 987 is not read 9 hundreds, 8 tens, 7 units.

It may be read "nine hundred eighty-seven units," but the word "units" is usually omitted.

2. Hundreds, tens, and units constitute **units' period**.

3. When we reach a thousand, we begin to name the thousands in order as we do the units, thus :

1 thousand, 2 thousand, etc., up to 999 thousand.

Thousands, ten-thousands, and hundred-thousands constitute **thousands' period**.

4. Write with figures 654 thousand 528 (units).

Read 362,475; 502,308; 750,000.

5. Just as 1000 units make 1 thousand, so 1000 thousands make 1 **million** (1,000,000), and 1000 millions make 1 **billion** (1,000,000,000).

TABLE

BILLIONS' PERIOD			MILLIONS' PERIOD			THOUSANDS' PERIOD			UNITS' PERIOD		
Hundred-billions	Ten-billions	Billions	Hundred-millions	Ten-millions	Millions	Hundred-thousands	Ten-thousands	Thousands	Hundreds	Tens	Units
3	6	5	4	8	2	7	2	5	9	3	8
		3	8	3	6	0	3	9	4	5	7
		72	0	0	0	0	2	4	6	0	6
3	0	4	2	0	0	3	4	1	0	0	0

6. The first number in the table is read :

“365 *billion*, 482 *million*, 725 *thousand*, 938.”

Read the other numbers in the table.

13. To read a large integral number :

*First, beginning at the right, separate the figures by commas into periods of three figures each.*

*Next, beginning at the left, read each period as if it stood alone, adding its name.*

The highest period may contain less than three figures.

**14. 1.** How many tens are there in 1 hundred? units in 1 ten? tenths in 1 unit? hundredths in 1 tenth? thousandths in 1 hundredth?

**2.** .5 denotes 5 tenths and is so read; .56 denotes 5 tenths and 6 hundredths, and is read "56 hundredths"; .567 is read "567 thousandths."

**3.** Read, and tell what each figure denotes:

.8	.62	.37	.80	.094	.140	.005
.7	.60	.07	.84	.095	.014	.301

**15.** *The Arabic notation is used to express integers and decimals. Ten units of any order, integral or decimal, make one unit of the next higher order.*

A dot called the **decimal point** is placed before tenths' figure.

*Tenths* occupy the *first* decimal place, *hundredths* the *second*, *thousandths* the *third*, and so on.

**16. 1.** Read the following mixed numbers:

$$7\frac{5}{10}, 7.5, 4\frac{7}{100}, 4.07, 5\frac{168}{1000}, 5.168.$$

A mixed number that is expressed as an integer and a decimal is called a **mixed decimal**. In reading mixed numbers, in this book "and" is used between the name of the integer and that of the fraction, but not elsewhere.

**2.** Read, and tell what each figure denotes:

5.3	6.32	28.41	1.125	36.404
8.7	4.75	50.67	3.146	80.225
6.5	8.06	32.04	8.073	37.670
3.9	5.88	90.02	6.008	20.006

26. Add \$2 and \$5; 6 qt. and 8 qt. Can you add 7 sheep and 9 cows? 7 animals and 9 animals?

*Only like numbers can be added.*

#### EXERCISES IN MAKING CHANGE

27. The picture shows a cash register. When a purchase amounting to, say, \$3.57 is made, the clerk presses the keys marked \$3, 50, and 7.

This registers the purchase on a slip of paper within, pushes up cards that show the amount of the purchase, and opens the cash drawer.

Suppose the purchaser has given the clerk \$5. The clerk puts the money into the drawer and may take out the change thus: three 1-cent pieces, a ten, a 5-cent

piece, a quarter, and a dollar. He then hands the change to the purchaser in the same order, saying as he does so: "Three fifty-seven, sixty, seventy, seventy-five, four dollars, five dollars."

Following are the amounts of some purchases and the sum of money paid the clerk in each case :

Tell what you would do if you were clerk — the keys of the cash register you would press, the pieces of money you would take out of the drawer, and what you would say to the purchaser as you handed him the change.

## EXERCISES

28. Add rapidly, both columns at once, thus in exercise 1, adding upward, " 11, 20, 30, 36, 44, 54, 65 " :

1. 11	2. 10	3. 11	4. 10	5. 9

6	10	9	11	11
10	10	3	4	6
9	7	11	11	10

Add rapidly, both columns at once:

<b>6.</b> 10	<b>7.</b> 11	<b>8.</b> 9	<b>9.</b> 10	<b>10.</b> 11

- 16.**  $\left. \begin{array}{l} 3 \\ 4 \\ 3 \\ 5 \\ 6 \end{array} \right\} \begin{array}{l} \\ 10 \\ \\ 11 \end{array}$  Learn to catch the sums of groups of numbers and add them, reading up the column rapidly.
- Thus, in the column in the margin read, "8, 18, 25, 34, 45, 55."
- Where possible, use groups of 10 or 11, as these sums are more easily added, but combine into any convenient groups. It is best not to pass over numbers in order to group by 10's, for there is danger of neglecting numbers once passed over.
- By practice you will be able to use groups that are larger and larger, but for the present they should not be over 11.

Practice until you can add all the following columns in less than  $1\frac{1}{2}$  minutes.

### WRITTEN EXERCISES

29. In adding numbers of two or more columns, the sum of each column should be retained in some way so that in case of error or interruption while adding any column it will not be necessary to go over all the previous columns.

A convenient method often used by business men is illustrated in the margin, the sums being written on a separate piece of paper. The sums of the columns, so written, give the required sum.

**CAUTION.** When this method of keeping the sums of the columns is used, care should be taken not to "carry" from one column to the next.

Add by grouping, and test each result by adding in the opposite direction :

Exercises 2-6 have been added and tested in less than 6 minutes. Can you do better?

### MULTIPLICATION

- 39.** 1. Count by 6's to 12 times 6. Give the table of 6's.  
 2. Count by 7's to 12 times 7. Give the table.  
 3. By counting in a similar way, obtain in order the tables of 8's, 9's, 10's, 11's, and 12's.  
 4. If you do not already know the multiplication tables perfectly, *commit them to memory now.*

In this table the 1's are written in the first row, the 2's in the second row, the 3's in the third row, and so on. To find the value of 7 times 8, for example, find 8 in the first column, thus locating the eighth row, in which all the 8's are written. 7 times 8, or 56, will be found in this row in the seventh column, or under the figure 7 in the top row.

*Remember*

**41.** 1. Find the sum of two 32's; of three 32's; of four 32's; of ten 32's.

2. Tell a short way to find the sum of several 32's.

**42.** A short process of finding the sum of equal numbers, or the process of taking one number as many times as there are units in another, is called **multiplication**.

**43.** The number taken or multiplied is called the **multiplcand**.

**44.** The number that shows how many times the multiplicand is taken is called the **multiplier**.

**45.** The result obtained by multiplying is called the **product**.

**46.** 1. How many dollars are 4 times \$20? How many trees are 4 times 20 trees? How many miles are 4 times 20 miles?

2. When 20 things of any kind are multiplied by 4, how many things are there in the product? What kind of things compose the product?

**47.** A number used without reference to any particular thing is called an **abstract number**.

2, 4, 20, etc., are abstract numbers.

**48.** A number used in connection with some particular thing is called a **concrete number**.

20 is a concrete number when it refers to dollars, or trees, or miles, etc.

**49.** Point out abstract and concrete numbers :

15 days	15 years	15	\$12	12¢	12
<u>6</u>	<u>6</u>	<u>6</u>	<u>5</u>	<u>5</u>	<u>5</u>
90 days	90 years	90	\$60	60¢	60

**50.** *The multiplier must be regarded as abstract. The product is like the multiplicand.*

51. 1. Compare 20 times 2 with 2 times 20; 12 times 4 with 4 times 12.

*In finding the product of two abstract numbers, either may be taken for the multiplicand.*

2.  $5 \times 11$  gal. is read "5 times 11 gallons";  $11 \text{ gal.} \times 5$  is read "11 gallons multiplied by 5";  $6 \times 7$  is read either "6 times 7" or "6 multiplied by 7."

The sign of multiplication is read *times* when it *precedes* the multiplicand, and *multiplied by* when it *follows* the multiplicand.

### EXERCISES

52. Read and complete the following. Name the multiplicand, the multiplier, and the product. Describe each as concrete or abstract.

| 11. How many days are there in 12 weeks? |                            |

### MODEL SOLUTION

1 week = 7 days;

12 weeks =  $12 \times 7$  days = 84 days.

Multiplicand and product denote days.

### WRITTEN EXERCISES

**61. 1.** How far will a train go in 24 hours at the rate of 40 miles an hour?

24  
40  
960, number of miles.

SOLUTION.—Since the train goes 40 miles an hour, in 24 hours it will go 24 times 40 miles.

Since  $24 \times 40 = 40 \times 24$ , the number of miles the train will go may be found either by multiplying 40 by 24, or by multiplying 24 by 40.

Since it is easier to multiply by 40 than by 24, we multiply by 40.

11. How many weeks are there in 365 days?

#### SOLUTION

7 days  $\overline{)365 \text{ days}}$

52 times, + 1 day

52 wk. 1 day

Since 7 days = 1 wk., 365 days are equal to as many weeks as 7 days are contained times in 365 days.

Then,  $365 \text{ days} = 52 \text{ wk. } 1 \text{ day} = 52\frac{1}{7} \text{ wk.}$

19. Divide 2457 by 40.

$$\begin{array}{r} 4\overline{)0245\cancel{7}} \\ \underline{6117} \\ 40 \end{array}$$

4 tens are contained in 245 tens, 61 times, with 1 ten remainder.

Therefore 40 is contained in 2450, 61 times, with 1 ten remainder; and in 2457, 61 times with 1 ten and 7 units, or 17, remainder.

Divide by 20, 30, 40, 50, 60, 70, 80, and 90 :

- |          |          |          |            |
|----------|----------|----------|------------|
| 20. 3433 | 22. 6257 | 24. 5827 | 26. 60,077 |
| 21. 1271 | 23. 4739 | 25. 3271 | 27. 97,001 |

Divide by 200, 300, 400, 500, 600, 700, 800, and 900 :

40. How much are the freight charges on 35,000 pounds of machinery sent from Vancouver to Ashcroft at 52¢ per 100 pounds?

\$ .52	
$\begin{array}{r} 35000 \\ \underline{2600} \\ 156 \\ \hline \end{array}$	Dividing 35,000 pounds by 100 pounds by cutting off the last two ciphers of 35,000, it is found that 35,000 pounds = 350 hundredweight. Since the freight on 1 hundredweight is \$.52, the freight on 350 hundredweight is 350 times \$.52, or \$182.
\$182.00

### WRITTEN EXERCISES

91. 1. Find the prime factors of 378.

$$\begin{array}{r} 2 \overline{) 378} \\ 9 \overline{) 189} \\ 3 \overline{) 21} \\ \underline{\phantom{0}7} \end{array}$$

Since the last figure of 378 is divisible by 2, what number is a factor of 378? Dividing by 2, what is the other factor?

Since the sum of the digits of 189 is divisible by 9, what number is a factor of 189? Dividing by 9, what is the other factor?

$$378 = 2 \times 3 \times 3 \times 3 \times 7$$

Since  $21 = 3 \times 7$  and the factors of 378 previously obtained were 2 and 9 or 2, 3, and 3,  $378 = 2 \times 3 \times 3 \times 3 \times 7$ .

$$300 = 2 \times 5 \times 2 \times 5 \times 3$$

$$\begin{array}{r} 10 \overline{) 840} \\ 4 \overline{) 84} \\ 3 \overline{) 21} \\ \underline{\phantom{0}7} \end{array}$$

$$840 = 5 \times 2 \times 2 \times 2 \times 3 \times 7$$

$$1485 = 5 \times 3 \times 3 \times 3 \times 11$$

Find the prime factors of :

93. *Cancelling equal factors from dividend and divisor, or dividing dividend and divisor by the same number, does not change the quotient.*

WRITTEN EXERCISES

94. 1. Divide  $21 \times 5 \times 16 \times 44$  by  $7 \times 25 \times 32 \times 11$ .

$$\begin{array}{r} 3 \qquad \qquad 2 \\ 21 \times 5 \times 16 \times 44 = 6 = 1\frac{1}{5} \\ \underline{7 \times 25 \times 32 \times 11} \quad 5 \quad 2 \end{array}$$

The dividend is written above the divisor with a line between them.

Dividing the dividend and divisor by 7 does not change the value of the quotient, hence the factor 7 may be canceled from 21 in the dividend, and from 7 in the divisor, leaving in their places 3 in the dividend and 1 in the divisor.

Next, the dividend and divisor may be divided by 5; then by 16; then by 11; and finally by 2, a factor of 4 and 2.

The remaining factors of the dividend are 3, 1, 1, and 2; of the divisor, 1, 5, 1, and 1. The quotient is  $\frac{6}{5}$  or  $1\frac{1}{5}$ .

NOTES.—1. When the process of cancellation is thoroughly understood, the 1's need not be written in dividend or divisor.

2. If all the factors of the dividend are canceled, the resulting dividend is 1. The same is true of the divisor. If all the factors of both dividend and divisor are canceled, the quotient is 1.

Divide :

2.  $8 \times 5 \times 30 \times 16 \times 15$  by  $4 \times 10 \times 6 \times 12 \times 3$
3.  $15 \times 48 \times 70 \times 11 \times 40$  by  $30 \times 16 \times 7 \times 22 \times 50$
4.  $17 \times 9 \times 12 \times 11 \times 28$  by  $34 \times 6 \times 72 \times 7 \times 22$
5.  $42 \times 35 \times 56 \times 4 \times 12$  by  $28 \times 49 \times 14 \times 10 \times 96$
6.  $3 \times 17 \times 48 \times 4 \times 65$  by  $5 \times 34 \times 13 \times 24 \times 12$
7.  $63 \times 36 \times 48 \times 27 \times 96 \times 69$  by  $81 \times 81 \times 144 \times 46$
8.  $48 \times 48 \times 20 \times 65 \times 36 \times 54$  by  $2880 \times 1080 \times 936$
9.  $792 \times 240 \times 35 \times 756$  by  $882 \times 180 \times 800 \times 33$
10.  $512 \times 27 \times 720 \times 847$  by  $64 \times 144 \times 99 \times 55$

4. Reduce  $\frac{4}{8}$  to halves;  $\frac{2}{6}$  to thirds;  $\frac{6}{16}$  to fifths;  $\frac{9}{12}$  to sixths.

**106.** *Multiplying or dividing both terms of a fraction by the same number does not change its value.*

**107.** A number that will exactly divide two or more numbers is called a **common divisor** of those numbers, and the *greatest* number that will exactly divide them is called their **greatest common divisor** (g. c. d.).

Since (§ 91)  $18 = 2 \times 3 \times 3$  and  $30 = 2 \times 3 \times 5$ , the *common* divisors of 18 and 30 are 2, 3, and  $2 \times 3$ , or 6; hence, their *greatest* common divisor is 6.

**108.** A fraction is expressed in its **lowest terms** when its terms have no *common divisor* except 1.

**109. 1.** Change to twelfths:  $\frac{1}{2}$ ;  $\frac{1}{3}$ ;  $\frac{2}{3}$ ;  $\frac{1}{4}$ ;  $\frac{3}{4}$ ;  $\frac{1}{6}$ ;  $\frac{5}{6}$ .

4. Reduce to lower terms :  $\frac{3}{9} ; \frac{2}{10} ; \frac{8}{12} ; \frac{7}{14} ; \frac{10}{31} ; \frac{8}{16}$ .
5. Reduce to lowest terms :  $\frac{4}{8} ; \frac{6}{12} ; \frac{8}{16} ; \frac{12}{16} ; \frac{10}{20} ; \frac{16}{24}$ .

WRITTEN EXERCISES

- 110. 1.** Reduce  $\frac{5}{8}$  to thirty-seconds.

$\frac{5}{8} \times 4 = \frac{20}{32}$  We have learned that it will not change the value of  $\frac{5}{8}$  to multiply both terms by any number.  $32 \div 8 = 4$ ; then we multiply both terms by 4.

2. Reduce to forty-eighths :  $\frac{1}{2} ; \frac{2}{3} ; \frac{3}{4} ; \frac{1}{6} ; \frac{7}{8} ; \frac{5}{12} ; \frac{9}{16}$ .
3. Reduce to sixtieths :  $\frac{1}{3} ; \frac{1}{4} ; \frac{2}{5} ; \frac{5}{6} ; \frac{3}{10} ; \frac{7}{12} ; \frac{8}{15} ; \frac{11}{20}$ .
4. Reduce  $\frac{45}{60}$  to its lowest terms.

$\begin{array}{r} 5 \overline{)45} = \frac{9}{9} \\ 5 \overline{)60} = \frac{12}{12} \end{array}$  We have learned that it will not change the value of  $\frac{45}{60}$  to divide both terms by any number. By § 89 we see that 5 and also 3 will exactly divide both terms of  $\frac{45}{60}$ . Dividing both terms by 5,  $\frac{45}{60} = \frac{9}{12}$ ; dividing the terms of  $\frac{9}{12}$  by 3,  $\frac{9}{12} = \frac{3}{4}$ .

The terms of  $\frac{3}{4}$  have no common divisor except 1; then  $\frac{45}{60}$  reduced to lowest terms is equal to  $\frac{3}{4}$ .

Or,  $\begin{array}{r} 15 \overline{)45} = \frac{3}{3} \\ 15 \overline{)60} = \frac{4}{4} \end{array}$  Or, we may directly divide both terms of the fraction by their greatest common divisor, 15 (§ 107).

14.  $\frac{1}{4}$  and  $\frac{1}{6}$

16.  $\frac{1}{3}, \frac{3}{4}, \frac{5}{12}$

18.  $\frac{1}{2}, \frac{2}{3}, \frac{7}{12}$

### WRITTEN EXERCISES

1. Reduce  $\frac{5}{8}$  and  $\frac{7}{12}$  to similar fractions.

$$\frac{5}{8} \times 3 = \frac{15}{24}$$

To change these fractions to similar fractions, a number must be selected for a common denominator that will **exactly contain each of the given denominators**. It is always desirable to select the smallest number that will **contain them**.

$$\frac{7}{12} \times 2 = \frac{14}{24}$$

It is seen that 24 will contain 8 and 12, and that no smaller number will contain both without a remainder.

Since  $24 \div 8 = 3$ , the terms of  $\frac{5}{8}$  must be multiplied by 3, and since  $24 \div 12 = 2$ , the terms of  $\frac{7}{12}$  must be multiplied by 2, giving for results the similar fractions  $\frac{15}{24}$  and  $\frac{14}{24}$ .

Reduce to similar fractions:

2.  $\frac{3}{4}$  and  $\frac{1}{5}$

6.  $\frac{5}{8}, \frac{1}{4}, \frac{7}{16}$

10.  $\frac{1}{2}, \frac{3}{5}, \frac{1}{6}$

3.  $\frac{1}{6}$  and  $\frac{3}{8}$

7.  $\frac{1}{3}, \frac{7}{8}, \frac{1}{4}$

11.  $\frac{3}{4}, \frac{2}{9}, \frac{5}{12}$

4.  $\frac{5}{9}$  and  $\frac{5}{6}$

8.  $\frac{4}{5}, \frac{2}{3}, \frac{9}{10}$

12.  $\frac{2}{5}, \frac{1}{8}, \frac{11}{20}$

5.  $\frac{7}{8}$  and  $\frac{3}{7}$

9.  $\frac{3}{4}, \frac{5}{8}, \frac{4}{5}$

13.  $\frac{7}{8}, \frac{7}{32}, \frac{9}{16}$

**127.** It is not always easy to discover by inspection the *least common multiple* of the given denominators, that is, the *least common denominator* (l. c. d.).

The l. c. d. may be found, however, by factoring the denominators, for it is the product of all their *different prime* factors, each factor used the greatest number of times that it occurs in any denominator.

Thus, if the given denominators are 6, 4, and 16, factoring we find:  
 $6 = 2 \times 3$ ;  $4 = 2 \times 2$ ; and  $16 = 2 \times 2 \times 2 \times 2$ .

Then, the factors of the l. c. d. are 2, 2, 2, 2 (the greatest number of 2's found in any denominator), and 3 (the only factor of any of them not already taken).

Hence, the l. c. d.  $= 2 \times 2 \times 2 \times 2 \times 3 = 48$ .

## WRITTEN EXERCISES

1. Reduce  $\frac{7}{12}$ ,  $\frac{5}{8}$ , and  $\frac{9}{10}$  to fractions having the l. c. d.

Factoring the denominators,  $12 = 2 \times 2 \times 3$ ;  $8 = 2 \times 2 \times 2$ ; and  $10 = 2 \times 5$ .

The factors of the l. c. d., then, are 2, 2, 2, 3, and 5.

Hence, the l. c. d.  $= 2 \times 2 \times 2 \times 3 \times 5 = 120$ , and the fractions become  $\frac{70}{120}$ ,  $\frac{75}{120}$ , and  $\frac{108}{120}$ .

Reduce to fractions having the l. c. d. :

2.  $\frac{3}{4}$ ,  $\frac{7}{12}$ ,  $\frac{9}{20}$

5.  $\frac{4}{15}$ ,  $\frac{23}{30}$ ,  $\frac{17}{20}$

8.  $\frac{3}{8}$ ,  $\frac{5}{16}$ ,  $\frac{3}{4}$ ,  $\frac{7}{32}$

3.  $\frac{2}{5}$ ,  $\frac{14}{25}$ ,  $\frac{8}{15}$

6.  $\frac{7}{12}$ ,  $\frac{11}{24}$ ,  $\frac{13}{18}$

9.  $\frac{1}{4}$ ,  $\frac{2}{3}$ ,  $\frac{4}{5}$ ,  $\frac{1}{2}$ ,  $\frac{5}{6}$

4.  $\frac{7}{8}$ ,  $\frac{9}{14}$ ,  $\frac{43}{56}$

7.  $\frac{5}{36}$ ,  $\frac{15}{16}$ ,  $\frac{19}{24}$

$$\frac{5}{6} + \frac{7}{8} + \frac{11}{12} =$$

$$\frac{20}{24} + \frac{21}{24} + \frac{22}{24} = \frac{63}{24} = 2\frac{5}{8}$$

$\frac{22}{24}$ . Adding these similar fractions, the sum is found to be  $\frac{63}{24} = 2\frac{5}{8}$  or  $2\frac{5}{8}$ .

14. Add  $23\frac{1}{2}$ ,  $49\frac{4}{5}$ , and  $36\frac{3}{4}$ .

$$\begin{array}{r} 23\frac{1}{2} = 23\frac{10}{20} \\ 49\frac{4}{5} = 49\frac{16}{20} \\ 36\frac{3}{4} = 36\frac{15}{20} \\ \hline 110\frac{1}{20} \end{array}$$

Reducing the fractions to fractions having the l.c.d., they become  $\frac{10}{20}$ ,  $\frac{16}{20}$ , and  $\frac{15}{20}$ , whose sum is  $\frac{41}{20}$  or  $2\frac{1}{20}$ . Writing  $\frac{1}{20}$  under the fractions and adding the 2 to the integers, the whole sum is found to be  $110\frac{1}{20}$ .

25. Find the difference between  $\frac{7}{8}$  and  $\frac{5}{12}$ .

$$\begin{array}{r} \frac{7}{8} - \frac{5}{12} = \\ \frac{21}{24} - \frac{10}{24} = \frac{11}{24} \end{array}$$

We have learned that the fractions must be changed to similar fractions before one can be subtracted from the other. Reducing them to their least common denominator,  $\frac{7}{8}$  becomes  $\frac{21}{24}$  and  $\frac{5}{12}$  becomes  $\frac{10}{24}$ ; then, the difference between  $\frac{21}{24}$  and  $\frac{10}{24}$  is seen to be  $\frac{11}{24}$ .

Find the difference between:

26. $\frac{3}{4}$ and $\frac{5}{16}$	29. $\frac{4}{5}$ and $\frac{1}{4}$	32. $\frac{14}{16}$ and $\frac{1}{2}$	35. $\frac{15}{16}$ and $\frac{5}{12}$
27. $\frac{19}{20}$ and $\frac{2}{5}$	30. $\frac{3}{8}$ and $\frac{1}{6}$	33. $\frac{11}{12}$ and $\frac{1}{8}$	36. $\frac{17}{20}$ and $\frac{4}{15}$
28. $\frac{7}{8}$ and $\frac{14}{24}$	31. $\frac{5}{6}$ and $\frac{3}{5}$	34. $\frac{9}{20}$ and $\frac{1}{4}$	37. $\frac{7}{12}$ and $\frac{7}{30}$

38. From  $84\frac{3}{8}$  subtract  $27\frac{3}{4}$ .

$$\begin{array}{r} 84\frac{3}{8} = 84\frac{3}{8} = 83\frac{11}{8} \\ 27\frac{3}{4} = 27\frac{6}{8} = 26\frac{14}{8} \\ \hline 56\frac{3}{8} \end{array}$$

Reducing the fractions to similar fractions, it is seen that  $\frac{3}{8}$  cannot be subtracted from  $\frac{3}{8}$ ; hence, 1 is taken from 84, changed to eighths, and combined with  $\frac{3}{8}$ ; then  $\frac{3}{8}$  is subtracted from  $\frac{11}{8}$  and 27 from 83, giving the remainder  $56\frac{3}{8}$ .

### WRITTEN EXERCISES

135. 1. Find  $\frac{7}{8}$  of 16;  $\frac{7}{8}$  of 18.

$$\frac{1}{8} \text{ of } 16 = 16 \div 8 = 2; \quad \frac{7}{8} \text{ of } 18 = \frac{1}{8} \text{ of } 7 \times 18 = \frac{1}{8} \text{ of } 126;$$

$$\frac{7}{8} \text{ of } 16 = 7 \text{ times } 2 = 14. \quad \frac{1}{8} \text{ of } 126 = 126 \div 8 = 15\frac{6}{8} = 15\frac{3}{4}.$$

Since 8 is exactly contained in 16, in finding  $\frac{7}{8}$  of 16 it is easier and shorter first to *divide* the integer 16 by the *denominator* 8 and then to *multiply* the quotient by the *numerator* 7, obtaining the result 14.

Since 8 is *not* exactly contained in 18, in finding  $\frac{7}{8}$  of 18 it is easier and shorter first to *multiply* the integer 18 by the *numerator* 7 and then to *divide* the product by the *denominator* 8.

It is still shorter to indicate the work and cancel.

$$\frac{7 \times 18}{8} = \frac{63}{4} = 15\frac{3}{4}.$$

141. 1. Find 8 times  $\frac{13}{24}$ .

$$8 \times \frac{13}{24} = \frac{8 \times 13}{\underset{3}{24}} = \frac{13}{3} = 4\frac{1}{3}$$

We have learned that to find 8 times  $\frac{13}{24}$  we may multiply the numerator 13 by 8. Indicating this as in the process, canceling, and reducing, the result is found to be  $4\frac{1}{3}$ .

## WRITTEN EXERCISES

150. 1. Divide  $2\frac{4}{5}$  by 8 ; $\frac{7}{8}$  by 6 ; $1\frac{5}{8}$  by 10.

$$\frac{24}{25} \div 8 = \frac{24 \div 8}{25} = \frac{3}{25} \qquad \frac{7}{8} \div 6 = \frac{7}{6 \times 8} = \frac{7}{48} \qquad \frac{15}{16} \div 10 = \frac{\overset{3}{15}}{\underset{2}{16} \times 16} = \frac{3}{32}$$

You have learned that dividing the numerator of a fraction divides the fraction; then, since the numerator 24 is exactly divisible by the integer 8, you should divide the numerator by 8. The result is  $\frac{3}{25}$ .

You have learned that multiplying the denominator of a fraction divides the fraction; then, since the numerator 7 is *not* divisible by the integer 6, you should multiply the denominator by 6. The result is  $\frac{7}{48}$ .

Usually the *shortest* way to divide a fraction by an integer is to indicate the multiplication of the denominator by the integer and then cancel whenever possible. Indicating and canceling, the result is  $\frac{3}{32}$ .

Divide :

2.  $1\frac{1}{2}$  by 4

6.  $\frac{3}{4}$  by 24

10.  $1\frac{3}{8}$  by 26

3.  $2\frac{0}{1}$  by 5

7.  $\frac{4}{5}$  by 32

11.  $\frac{5}{18}$  by 25

4.  $2\frac{4}{5}$  by 8

8.  $\frac{5}{6}$  by 40

12.  $1\frac{2}{3}$  by 38

5.  $3\frac{6}{2}$  by 9

9.  $\frac{7}{8}$  by 42

13.  $2\frac{2}{3}$  by 33

14. Divide  $13\frac{3}{4}$  by 5 ;

$$13\frac{3}{4} = \frac{55}{4}$$

$$\frac{55}{4} \div 5 = \frac{11}{4} = 2\frac{3}{4}$$

The integral part of the dividend is *small*; in such a case the mixed number may be reduced to an improper fraction and the division performed as before.

The quotient is  $2\frac{3}{4}$ .

$213\frac{3}{4}$  by 5.

$$\begin{array}{r} 5 \overline{)213\frac{3}{4}} \\ 42\frac{3}{4} \end{array}$$

The integral part of the dividend is *large* and the divisor is small; in this case short division may be used: thus, 5 is contained in  $213\frac{3}{4}$ , 42 times with  $\frac{3}{4}$ , or  $\frac{15}{4}$ , undivided;  $\frac{15}{4} \div 5 = \frac{3}{4}$ ; then the entire quotient is  $42\frac{3}{4}$ .

Divide:

15.  $18\frac{2}{3}$  by 4

19.  $241\frac{1}{2}$  by 3

23.  $1347\frac{1}{6}$  by 2

16.  $12\frac{5}{6}$  by 7

20.  $474\frac{2}{5}$  by 8

24.  $3476\frac{1}{4}$  by 6

17.  $21\frac{3}{8}$  by 6

21.  $738\frac{4}{7}$  by 5

25.  $5286\frac{7}{8}$  by 9

18.  $53\frac{3}{4}$  by 5

22.  $815\frac{5}{8}$  by 9

26.  $6304\frac{2}{7}$  by 5

27. Divide  $768\frac{3}{4}$  by 15.

$$\begin{array}{r} 15 \overline{)768\frac{3}{4}} \\ \underline{4 \quad 4} \phantom{00} \\ 60 \overline{)3075} (51\frac{1}{4} \\ \underline{300} \phantom{00} \\ 75 \\ \underline{60} \phantom{00} \\ 15 \\ \underline{15} 0 = \frac{1}{4} \end{array}$$

Here it is necessary to use long division. Before dividing, change both divisor and dividend to fourths obtaining 60 (fourths) and 3075 (fourths), respectively.

Dividing as in integers, the quotient is found to be  $51\frac{1}{4}$ .

$$18 \div \frac{4}{5} = \frac{18 \times 5}{4} = \frac{45}{2} = 22\frac{1}{2}$$

Since  $1 \div \frac{1}{5} = 5$ ,  $18 \div \frac{1}{5} = 18 \times 5$ ; then,  $18 \div \frac{4}{5} = \frac{1}{4}$  of  $18 \times 5$  ( $\$ 152, 4$ ), or  $\frac{18 \times 5}{4}$ . Canceling and reducing, the result is found to be  $22\frac{1}{2}$ .

WRITTEN EXERCISES

160. 1. If 679 is  $\frac{7}{8}$  of a number, what is the number?

SOLUTION.

$\frac{7}{8}$  of the number = 679.

$\frac{1}{8}$  of the number =  $\frac{1}{7}$  of 679, or 97.

$\frac{8}{8}$  of the number =  $8 \times 97$ , or 776.

## DECIMAL FRACTIONS

**162. Review definitions.**

1. Fractions that express tenths or hundredths or thousandths, etc., are called either **decimal fractions**, or simply **decimals**.

The term "decimals" is more commonly applied to decimal fractions that are expressed with a *decimal point*.

.3 and .25 are decimal fractions, or decimals.

2. Fractions that do not express tenths, or hundredths, or thousandths, etc., are called **common fractions**.

$\frac{1}{2}$ ,  $\frac{25}{100}$ ,  $\frac{1}{3}$  are common fractions.

## Reduction of Decimals

**163. Reduction of decimals to common fractions.**

## WRITTEN EXERCISES

1. Reduce 7.025 to a mixed number having its decimal part expressed as a common fraction in its lowest terms.

$$7.025 = 7\frac{25}{1000} = 7\frac{1}{40}.$$

Reduce the following to common fractions in their lowest terms, or to mixed numbers with the fractional part in lowest terms:

2. .5	7. .15	12. 7.05	17. 7.625
3. .4	8. .25	13. 3.75	18. 4.875
4. 1.6	9. .32	14. .125	19. 9.324
5. 7.8	10. .65	15. .375	20. 6.075
6. 8.4	11. .95	16. .875	21. 5.012

**164. Reduction of common fractions to decimals.**

1. How many tenths are there in 1? in 3? Then how many tenths are there in  $\frac{1}{5}$  of 3, or in  $\frac{3}{5}$ ?

$$\begin{array}{r} 5 \overline{)30} \text{ tenths} \\ \underline{\phantom{0}6} \text{ tenths} \end{array}$$

$$\begin{array}{r} 5 \overline{)3.0} \\ \underline{\phantom{0}.6} \end{array}$$

2. How many hundredths are there in 3? Then how many hundredths are there in  $\frac{1}{4}$  of 3, or in  $\frac{3}{4}$ ?

$$\begin{array}{r} 4 \overline{)300} \text{ hundredths} \\ \underline{\phantom{00}**} \text{ hundredths} \end{array}$$

$$\begin{array}{r} 4 \overline{)3.00} \\ \underline{\phantom{00}***} \end{array}$$

3. Reduce  $\frac{5}{8}$  to thousandths in this way:

$$\begin{array}{r} 8 \overline{)5000} \text{ thousandths} \\ \underline{\phantom{000}***} \text{ thousandths} \end{array}$$

$$\begin{array}{r} 8 \overline{)5.000} \\ \underline{\phantom{000}***} \end{array}$$

WRITTEN EXERCISES

**165. 1. Reduce  $\frac{2}{3}$  to a decimal.**

$$\begin{array}{r} 3 \overline{)2.000} \\ \underline{\phantom{000}.666} \frac{2}{3} \end{array}$$

Since  $\frac{2}{3} = 2 \div 3$ , divide 2 by 3.

$\frac{1}{3}$  of 20 tenths = 6 tenths and 2 tenths remaining.

2 tenths = 20 hundredths.

$\frac{1}{3}$  of 20 hundredths = 6 hundredths and 2 hundredths remaining.

2 hundredths = 20 thousandths.

$\frac{1}{3}$  of 20 thousandths =  $6\frac{2}{3}$  thousandths.

Therefore,  $\frac{2}{3} = .666\frac{2}{3}$ .

One decimal cipher is annexed for each decimal place required. At present results need not be carried beyond three decimal places.

Reduce to decimals:

2.  $\frac{2}{5}$

7.  $\frac{3}{8}$

12.  $\frac{5}{6}$

17.  $\frac{5}{12}$

3.  $\frac{3}{5}$

8.  $\frac{5}{8}$

13.  $\frac{2}{7}$

18.  $\frac{17}{20}$

4.  $\frac{4}{5}$

9.  $\frac{7}{8}$

14.  $\frac{4}{9}$

19.  $\frac{13}{500}$

5.  $\frac{1}{4}$

10.  $\frac{1}{3}$

15.  $\frac{7}{9}$

20.  $\frac{77}{200}$

6.  $\frac{1}{2}$

11.  $\frac{1}{6}$

16.  $\frac{3}{11}$

21.  $\frac{6}{700}$

Ciphers at the right of a decimal may be *omitted*.

13. Multiply 42.46 by  $6\frac{2}{3}$ .

$$\begin{array}{r} 42.46 \\ \quad 6\frac{2}{3} \\ \hline 3)84.92 \\ \underline{28.30\frac{2}{3}} \\ 254.76 \\ \underline{283.06\frac{2}{3}} \end{array}$$

42.46 multiplied by  $6\frac{2}{3}$  is equal to the sum of  $\frac{2}{3}$  of 42.46 and 6 times 42.46.

$$\begin{aligned} \frac{2}{3} \text{ of } 42.46 &= \frac{1}{3} \text{ of } 2 \text{ times } 42.46 \\ &= \frac{1}{3} \text{ of } 84.92 \\ &= 28.30\frac{2}{3} \\ 6 \times 42.46 &= 254.76 \end{aligned}$$

Therefore the product is  $28.30\frac{2}{3} + 254.76$ , or  $283.06\frac{2}{3}$ .

## WRITTEN EXERCISES

176. 1. Divide 568 by 30.

$$30 \overline{)568.00}$$

$$18.933\frac{1}{3}$$

30 is contained in 568 as many times as 3 is contained in 56.8.

Dividing 56.8 by 3, the division is found to be inexact in tenths' place. Therefore, one cipher is annexed to the dividend, and the division is carried to hundredths. The division being inexact in hundredths' place, another cipher is annexed and the division is carried to thousandths, giving 3 thousandths and 1 thousandth remainder.

It is not necessary to carry this division beyond thousandths. The result of the last division is written in the quotient as  $3\frac{1}{3}$  thousandths, or the quotient to thousandths may be written 18.933.

In the following exercises, find quotients to thousandths.

## EXERCISES

**183. 1.** How many articles costing 50¢ each can be bought for each of the following sums:

\$1?    \$2?    \$5?    \$12?    \$1.50?    \$3.50?    \$7.50?

**2.** How many 25-cent articles can be bought for:

\$1?    \$4?    \$.50?    \$2 + \$.25?    \$3.50?

\$2?    \$11?    \$.75?    \$2 + \$.75?    \$6.25?

**3.** How many  $12\frac{1}{2}$ -cent articles can be bought for:

\$1?    \$5?    \$.25?    \$1 + \$.50?    \$3.25?

\$3?    \$12?    \$2 + \$.25?    \$2 + \$.75?    \$5.75?

\$2?    \$6?    \$12?    \$15?    \$50?

How many  $16\frac{2}{3}$ -cent articles can be bought for the same amounts?

## WRITTEN EXERCISES

**184. 1.** How many yards of silk costing \$1.12 $\frac{1}{2}$  per yard can be bought for \$315?

Since \$1.12 $\frac{1}{2}$  = \$1 $\frac{1}{4}$ , or \$ $\frac{5}{4}$ , the number of yards is equal to the number of times \$315 contains \$ $\frac{5}{4}$ , which may be found by dividing 315 by  $\frac{5}{4}$ , or by multiplying 315 by  $\frac{4}{5}$ .

Hence, 280 yards may be bought for \$315.

Find the number of articles that can be bought for:

**2.** \$65 at \$1.25 each

**6.** \$98 at \$.66 $\frac{2}{3}$  each

**3.** \$85 at \$2.50 each

**8.** \$540 at \$2.25 each

**5.** \$27 at \$.37 $\frac{1}{2}$  each

**9.** \$160 at \$1.33 $\frac{1}{3}$  each

Folded sheets of paper are often sold by the following measures :

$$\begin{aligned} 24 \text{ sheets} &= 1 \text{ quire} \\ 20 \text{ quires} &= 480 \text{ sheets} = 1 \text{ ream} \end{aligned}$$

## EXERCISES

**194. 1.** If a girl uses 1 doz. sheets of paper and 1 doz. envelopes per month, how many boxes of stationery, each containing 1 quire of paper and 24 envelopes, will she use in a year?

**2.** A boy buys a  $2\frac{1}{2}$ -quire box of writing paper. How many letters of 1 sheet each can he write on the paper?

## Measurement of Angles and Arcs

**195.** 1. Face toward the north, then turn until you face the west. Continue to turn until you face the north again.

2. What part of a complete turn do you make in turning from north to west? from west to south? from south to east? from north to south?

3. Which is the greater amount of turning or change of direction—from north to northwest or from north to west? from north to west or from north to southwest?

**196.** That which expresses the amount of turning, or of change of direction, is called an **angle**.

**197.** A complete turn is called an angle of 360 **degrees**.

Therefore  $\frac{1}{360}$  of a complete turn is called 1 degree ( $1^\circ$ ).

**198.** One fourth of a complete turn, or an angle of  $90^\circ$ , is called a **right angle**.

**199.** An angle that is less than a right angle is called an **acute angle**.

**200.** An angle that is greater than a right angle but less than two right angles is called an **obtuse angle**.

**201.** The size of an angle does not depend on the length of the lines that form its *sides*, but it depends only on the difference of direction of the sides, or on the amount of turning required to change the direction of one side to that of the other.

For example, these six angles are all equal, each being  $60^\circ$ , although the sides are of different lengths.

## EXERCISES

**202. 1.** Make a paper square. What kind of angles do the sides form? How many degrees are there in each?

**2.** Draw two lines connecting the opposite corners, as shown in the diagram.

These lines are called **diagonals**.

**3.** Fold the paper square so that *A* lies on *C*. Crease it, then unfold it and notice whether the diagonal *BD* coincides with the crease.

How, then, are the right angles at *B* and *D* divided by the diagonal *BD*? How many degrees are there in each smaller angle at *B* and at *D*?

**4.** Fold the square along *BD*, and then so that *D* lies on *B*. Compare the angles at *O*. How many degrees are there in each?

**203.** The boundary line of a circle is called its **circumference**. Any part of the circumference is called an **arc**.

**204. 1.** In the second figure, what part of  $360^\circ$  is each angle? What part of the circumference is each arc?

**2.** What part of  $360^\circ$  is each angle and what part of the circumference is each arc in the third figure? in the fourth?

**3.** In these figures *O*, the *center* of each circle, is also the *vertex* of each angle. Such angles are called **central angles**.

**4.** Since an arc is the same part of a circumference that its central angle is of  $360^\circ$ , we measure *arcs* as well as *angles*, in *degrees*, calling a circumference  $360^\circ$ .

5. How many degrees are there in an arc that is  $\frac{1}{4}$  of a circumference?  $\frac{1}{6}$  of a circumference?  $\frac{1}{10}$  of a circumference?
6. What part of  $360^\circ$  is an angle or an arc of 1 degree?
7. Angle degrees and arc degrees are divided into 60 parts called **minutes**, and minutes into 60 parts called **seconds**.
8. Memorize this table:

60 seconds ( $60''$ )	= 1 minute ( $1'$ )
60 minutes	= 1 degree ( $1^\circ$ )
360 angle degrees	= 4 right angles
360 arc degrees	= 1 circumference

## EXERCISES

2. How many minutes are there in a right angle? in  $5^\circ$ ? in  $3^\circ 40'$ ? in  $90''$ ?
3. How many seconds are there in  $40'$ ? in  $1^\circ$ ? in  $10' 20''$ ? in  $5' 30''$ ? in  $2^\circ$ ? in  $\frac{3}{4}$  of a minute?

## Measurement of Surfaces

206. A figure that has four straight sides and four right angles is called a **rectangle**.

If the sides of a rectangle are all equal, it is called a **square**.

207. Lines that cannot meet, however far they are extended, are called **parallel lines**.

208. A four-sided figure whose opposite sides are parallel is called a **parallelogram**.

A rectangle is a right-angled parallelogram.

**209.** A three-sided figure is called a **triangle**.

A triangle is *acute-angled* if all its angles are acute; *right-angled* if it has one right angle; *obtuse-angled* if it has one obtuse angle.

ACUTE-ANGLED TRIANGLE

RIGHT-ANGLED TRIANGLE

OBTUSE-ANGLED TRIANGLE

**210.** The two lines that form a right angle are said to be **perpendicular** to each other.

**211.** The side of a figure on which it is assumed to stand is called the **base**, and the height of the figure measured on a line perpendicular to the base is called the **altitude**.

The following figures have different bases but the same altitude.

## 212. Rectangles.

1. What is the area of a rectangle whose base is 24 in. and altitude 2 in.?

Find the area if the base is 2 ft. and the altitude is 2 in.

2. How is the area of a rectangle found?

What must be done if the base and altitude are expressed in different units?

3. Find the area of a rectangle whose base is 12 ft. and altitude 4 ft. How many times as great must the altitude be to make the area 48 sq. ft.?

4. The area of a certain rectangle is 48 sq. ft. If the base is 6 ft., what is the altitude?

If the base is 12 ft., what is the altitude?

If the altitude is 3 ft., what is the base?

**213.** If the base and altitude of a rectangle are expressed in *inches*, the area is found by multiplying the *number* of inches in the base by the *number* of inches in the altitude and calling the result *square inches*. If both dimensions are in *feet*, the area is found by multiplying one dimension by the other and calling the result *square feet*.

This is what is meant by the following statement:

*The area of a rectangle is equal to the product of its base and altitude, expressed in like units.*

It is seen that *either dimension is the quotient of the area and the other dimension, expressed in corresponding units.*

#### WRITTEN EXERCISES

**214. 1.** Find the area of a rectangle 12 ft. by 2 ft. 6 in.

##### SOLUTION

Base = 12 ft.

Alt. =  $2\frac{1}{2}$  ft.

Area =  $(2\frac{1}{2} \times 12)$  sq. ft. = 30 sq. ft.

number of *square feet* in the area is found by multiplying 12 by  $2\frac{1}{2}$ .

Since the base and altitude must be expressed in *like units*, 2 ft. 6 in. is first changed to *feet*. Then the

**2.** If the area of a rectangular field is 24 acres and the length is 60 rods, what is the width?

##### SOLUTION

Area = 24 A. =  $24 \times 160$  sq. rd.

Length = 60 rd.

Width =  $\frac{24 \times 160}{60}$  rd. = 64 rd.

Since the area and the length must be expressed in *corresponding units*, 24 A. is first changed to *square rods*. Then, the number of *rods* in the width is found by dividing  $24 \times 160$  by 60.

## WRITTEN EXERCISES

229. 1. Find  $\frac{4}{5}$  of  $\frac{7}{12}$ , or multiply  $\frac{7}{12}$  by  $\frac{4}{5}$ .

$$\frac{4}{5} \times \frac{7}{12} = \frac{4 \times 7}{5 \times 12} = \frac{7}{15}$$

To find  $\frac{4}{5}$  of  $\frac{7}{12}$  we divide  $\frac{7}{12}$  by 5. You have learned that this may be done by multiplying the denominator by 5; then,  $\frac{1}{5}$  of  $\frac{7}{12} = \frac{7}{5 \times 12}$ ,

Or 
$$\frac{4}{5} \times \frac{7}{12} = \frac{7}{15}$$

and  $\frac{4}{5}$  of  $\frac{7}{12} = 4$  times  $\frac{1}{5}$  of  $\frac{7}{12}$ , or  $\frac{4 \times 7}{5 \times 12}$ .

Canceling and multiplying, the result is found to be  $\frac{7}{15}$ .

It is not necessary to rewrite the fractions.

We may simply cancel as in the second process.

### 234. Simplifying complex fractions.

You have learned that fractions indicate division, the numerator being the dividend and the denominator the divisor.

We may indicate the division of a fraction by an integer, of an integer by a fraction, or of a fraction by a fraction, in *fractional form*, by writing the dividend above a line and the divisor below.

We may write,  $\frac{3}{4} \div 6$  like this,  $\frac{\frac{3}{4}}{6}$ ;  $8 \div \frac{3}{4}$  like this,  $\frac{8}{\frac{3}{4}}$ ; and  $\frac{1}{2} \div \frac{1}{3}$  like this,  $\frac{\frac{1}{2}}{\frac{1}{3}}$ .

Such indicated expressions of division are sometimes called **complex fractions**.

When the indicated division is performed, the complex fraction is said to be **simplified**.

## DECIMAL FRACTIONS

## Notation and Numeration of Decimals

**242.** The orders of decimals below thousandths are ten-thousandths, hundred-thousandths, millionths, etc., as shown in the following table.

The orders below millionths are ten-millionths, hundred-millionths, billionths, ten-billionths, etc. They are seldom used.

Hundreds	Tens	Units	Decimal Point	Tenths	Hundredths	Thousandths	Ten-thousandths	Hundred-thousandths	Millionths
3	6	5	.	7	4	3	2	9	8
	4	0	.	0	0	2	4		
	8	8	.	3	0	6	9	6	

- 365.743298 is read "365 and 743,298 millionths."  
 40.0024 is read "40 and 24 ten-thousandths."  
 88.30696 is read "88 and 30,696 hundred-thousandths."

- What decimal place is occupied by

Thousandths?	Ten-thousandths?	Hundred-thousandths?
Millionths?	Ten-millionths?	Hundred-millionths?

- How many decimal figures are required to express thousandths? ten-thousandths? hundred-thousandths? millionths? ten-millionths? hundred-millionths?

- 1, .1, .01, .001, .0001, .00001, .000001.

What part is each decimal of the number on its left?

How many tenths are there in 1? hundredths in .1? etc.

*In the Arabic or decimal system of notation, a unit of any order is  $\frac{1}{10}$  of the next higher or left-hand unit, and 10 times the next lower or right-hand unit.*

*In reading a decimal, it should be read as an integer, and the denomination of the right-hand figure should be added.*

In reading a mixed decimal, in this book the word "and" is used between the integral and decimal parts, and not elsewhere.

### Reduction of Decimals

245. Reduction of decimals to common fractions.

#### WRITTEN EXERCISES

1. Reduce .0625 to a common fraction.

SOLUTION.  $.0625 = \frac{625}{10000} = \frac{1}{16}$ .

Reduce to common fractions in their lowest terms:

- |          |            |             |
|----------|------------|-------------|
| 2. .625  | 9. .03125  | 16. .53125  |
| 3. .1875 | 10. .09375 | 17. .65625  |
| 4. .3125 | 11. .15625 | 18. .78125  |
| 5. .4375 | 12. .21875 | 19. .96875  |
| 6. .5625 | 13. .28125 | 20. .890625 |
| 7. .6875 | 14. .34375 | 21. .609375 |
| 8. .8125 | 15. .40625 | 22. .484375 |

**246. Reduction of common fractions to decimals.**

WRITTEN EXERCISES

1. Reduce  $\frac{4}{7}$  to a six-place decimal.

$$\begin{array}{r} 7 \overline{)4.000000} \\ \underline{.571429-} \end{array}$$

$\frac{1}{7}$  of 40 tenths = 5 tenths and 5 tenths remaining;  
 $\frac{1}{7}$  of 5 tenths or of 50 hundredths = 7 hundredths  
 and 1 hundredth remaining; and so on. The last  
 division gives  $\frac{1}{7}$  of 60 millionths =  $8\frac{4}{7}$  millionths. Since  $8\frac{4}{7}$  millionths is  
 nearer 9 millionths than 8 millionths, 9 is written in the quotient rather  
 than 8; but a small minus sign is written after the 9 to show that the true  
 quotient is a little less than .571429.

In the following, no results need be carried beyond six  
 decimal places.

2. Reduce  $\frac{4}{27}$  to a six-place decimal.

By Long Division

$$\begin{array}{r} .148148+ \\ 27 \overline{)4.0000} \\ \underline{27} \\ 130 \\ \underline{108} \\ 220 \\ \underline{216} \end{array}$$

40, etc., as from the beginning.

By Short Division

$$\begin{array}{r} 3 \overline{)4.000000} \\ 3 \overline{)1.333333+} \\ 3 \overline{).444444+} \\ \underline{.148148+} \end{array}$$

The small plus signs show that the true quotients are a little larger than  
 those set down, but less than  $\frac{1}{2}$  millionth larger.

After finding the first three figures of the quotient by long division, it is  
 found that the new dividend is like the original dividend. Hence, the next  
 three figures of the quotient will be like the first three; and in fact the  
 same set of figures will recur, however far the division is carried.

The short division process is advised when the divisor can be separated  
 readily into factors.

Reduce to decimals, not beyond six places :

3. $\frac{1}{4}$	10. $\frac{5}{6}$	17. $\frac{5}{12}$	24. $\frac{9}{32}$
4. $\frac{1}{8}$	11. $\frac{5}{8}$	18. $\frac{5}{16}$	25. $\frac{13}{32}$

The product of 63 and 48 is 3024.

Since the multiplicand .63 has two decimal places and the multiplier .48 two decimal places, the product must contain  $2 + 2$ , or *four*, decimal places.

Therefore, the product is .3024.

Decimal ciphers on the right of the product are *omitted*.

## Division of Decimals

**252.** Divide:

1.  $2 \overline{)8}$     2 tenths  $\overline{)8 \text{ tenths}}$      $.2 \overline{).8}$      $.02 \overline{).08}$      $.002 \overline{).008}$

2. Compare the quotient obtained by dividing .8 by .2 with that obtained by dividing 8 by 2.

4. When the divisor is a decimal, we make the division easier by multiplying both dividend and divisor by a number that will change the *divisor* to an *integer*.

5. Change  $.2 \overline{).84}$  to  $2 \overline{)8.4}$  and then divide.

6. Change  $.02 \overline{).184}$  to  $2 \overline{)18.4}$  and then divide.

7. How should the dividend and the divisor be prepared for division when the divisor contains one decimal figure? two decimal figures? any number of decimal figures?

**253.** *The divisor may be changed to an integer, without changing the value of the quotient, by moving the decimal points in both dividend and divisor toward the right as many places as there are decimal figures in the divisor.*

When the dividend and divisor have been prepared for division by changing the divisor to an integer, the decimal point of the quotient should be placed vertically above or below that of the dividend.

Since the divisor expresses thousandths, to change the divisor to an integer *without changing the quotient*, both dividend and divisor are multiplied by 1000 by moving the decimal point in each three places toward the right.

Divide:

When the dividend contains fewer decimal figures than the divisor, the deficiency should be made up, before moving the decimal point, by annexing decimal ciphers. Thus, exercise 18,  $5 \div .15625 = 5.00000 \div .15625$ .

**256. 1.** Find the value of  $.4 \times .6$ ; of  $\frac{.4 \times .6}{.12}$ .

2. How will the value of the dividend be affected if *one* of the factors, as  $.4$ , is multiplied by 10? if *both* factors are multiplied by 10?

3. If both factors of the dividend are multiplied by 10, by what number must the divisor be multiplied to prevent the quotient from being changed?

4. How, then, does  $\frac{.4 \times .6}{.12}$  compare in value with  $\frac{4 \times 6}{12}$ ?

#### WRITTEN EXERCISES

**257. 1.** Divide  $7.5 \times 1.8 \times .33$  by  $9.9 \times .25 \times 12$ .

$$\frac{\overset{3}{75} \times 18 \times \overset{33}{33}}{\overset{99}{99} \times 25 \times \overset{12}{12} \times 10} = \frac{3}{20} = .15$$

Omitting decimal points from the dividend multiplies it by  $10 \times 10 \times 100$ , or by 10,000. Omitting decimal points from the divisor multiplies it by  $10 \times 100$ , or by 10,000. Consequently, to free both dividend and divisor of decimals *without changing the quotient*, after omitting decimal points we must multiply the divisor by 10. By cancellation the quotient is then found to be  $\frac{3}{20}$ , or .15.

Divide:

2.  $4.2 \times 1.6$  by  $.56$

## DENOMINATE NUMBERS

**263.** To ascertain the quantity of anything, or to *measure* it, is to find how many times it contains some established unit called the **unit of measure**.

Thus, to measure the corn in a bin is to find how many times the whole quantity of corn in the bin contains some unit measure, as 1 bushel, or 1 hundredweight.

A concrete number in which the unit of measure is established by law or custom is called a **denominate number**.

16 bushels is a denominate number; also 16 bushels 3 pecks.

**264.** A denominate number that is composed of units of one denomination only is called a **simple denominate number**.

16 bushels is a simple denominate number.

**265.** A denominate number that is composed of units of two or more denominations that are related to each other is called a **compound denominate number**.

16 bushels 3 pecks is a compound denominate number.

Tables of denominate numbers will be found on pages 278-280.

2. Reduce  $1\frac{1}{2}$  yards to feet; to inches.
3. How many inches are there in 1 yd. 1 ft. 2 in.

Reduce:

- |                                      |  |
|--------------------------------------|--|
| 4. $\frac{5}{8}$ lb. to ounces.      | 9. $\frac{1}{4}$ day to minutes.       |
| 5. 1.4 T. to pounds.                 | 10. .75 gal. to pints.                 |
| 6. .3 mile to rods.                  | 11. $.12\frac{1}{2}$ bu. to quarts.    |

## WRITTEN EXERCISES

267. 1. Reduce 5 hr. 15 min. 12 sec. to seconds.

$$\begin{array}{r}
 5 \text{ hr.} \\
 60 \\
 \hline
 300 \\
 + 15 \\
 \hline
 315 \text{ min.} \\
 60 \\
 \hline
 18900 \\
 + 12 \\
 \hline
 18912 \text{ sec.}
 \end{array}$$

Since there are 60 minutes in an hour, in 5 hours there are  $5 \times 60$  minutes, or 300 minutes, and in 5 hr. 15 min. there are 300 minutes + 15 minutes, or 315 minutes.

Since there are 60 seconds in a minute, in 5 hr. 15 min. 12 sec., or in 315 min. 12 sec., there are  $315 \times 60$  seconds, and 12 seconds more, or 18,912 seconds.

2. Reduce 18,912 seconds to hours, minutes, and seconds.

$$60 \overline{)18912}$$

$$60 \overline{)315, + 12 \text{ sec.}}$$

$$5, + 15 \text{ min.}$$

$$5 \text{ hr. } 15 \text{ min. } 12 \text{ sec.}$$

Since 60 sec. = 1 min., 18,912 sec. = 315 min. and 12 sec. over.

Since 60 min. = 1 hr., 315 min. = 5 hr. and 15 min. over.

Hence 18,912 sec. = 5 hr. 15 min. 12 sec.

Reduce :

Reduce to compound denominate numbers :

- |                      |                          |                     |

# Addition and Subtraction

## WRITTEN EXERCISES

269. 1. Add 12 ft. 6 in. and 14 ft. 9 in.

ft.	in.	
12	6	
14	9	
27	3	

The sum of the inches is 15 in., or 1 ft. 3 in.; consequently 3 is written in the column for inches, and 1 is reserved to be united with the numbers in the column for feet.

The sum of the feet is 27 ft.

Hence, the entire sum is 27 ft. 3 in.

Add the following :

	ft.	in.		yd <sup>3</sup>	in.		gal.	qt.
2.	8	4	3.	4	24	4.	16	3 $\frac{1}{2}$

17. Subtract 5 lb. 7 oz. from 21 lb. 2 oz.

lb.	oz.	
21	2	Since 7 oz. cannot be subtracted from 2 oz., 1 lb. taken from the 21 lb. is reduced to ounces and united with the
5	7	2 oz., giving 18 oz. 18 oz. - 7 oz. = 11 oz., which is written in the remainder. Next subtracting 5 lb. from the
<u>15</u>	<u>11</u>	20 lb. left in the minuend, the number of pounds in

the remainder is found to be 15.

Hence, the remainder is 15 lb. 11 oz.

Subtract :

27. How long was it from Apr. 10, 1899, to Feb. 2, 1906?

yr.	mo.	da.	
1906	2	2	The later date is written as the minuend
1899	4	10	and the earlier date as the subtrahend, writing
<u>6</u>	<u>9</u>	<u>22</u>	the number of the month instead of its name.

Subtract as in denominate numbers, considering 30 days as a month and 12 months as a year. The remainder is the difference in time as accurately as it can be expressed in years, months, and days.

Subtract :

	yr.	mo.	da.		yr.	mo.	da.		yr.	mo.	da.
28.	1907	1	1	29.	1906	12	25	30.	1910	3	2

How near the north pole ( $90^{\circ}$  north latitude) did each expedition reach? Express the distance in miles, taking  $1' = 1.15$  mi.

## Multiplication

## WRITTEN EXERCISES

**270. 1.** Multiply 16 bu. 3 pk. by 7.

bu.	pk.	
16	3	7 times 3 pk. = 21 pk. = 5 bu. 1 pk.
	7	7 times 16 bu. = 112 bu., and 112 bu. + 5 bu. = 117 bu.
117	1	The product is 117 bu. 1 pk.

Multiply :

2. 9 ft. 8 in. by 6

6.  $16^{\circ} 35' 20''$  by 4

3. 7 gal. 3 qt. by 5

7.  $11^{\circ} 0' 16''$  by 15

4. 2 hr. 9 min. by 8

8. 24 lb. 9 oz. by 20

5. 6 bu. 3 pk. by 4

9. 4 yr. 11 mo. by 11

10. Find the area, in square feet, of a rectangle 5 ft. 5 in. long and 2 ft. 6 in. wide.

	65	
	30	
12	1950	... sq. in.
12	162.5	
	13.542	... sq. ft.

Since 5 ft. 5 in. = 65 in., and 2 ft. 6 in. = 30 in., the number of square inches in the area is  $30 \times 65$ , or 1950 sq. in.

Since there are 144 sq. in. in a square foot, the area in square feet may be obtained by dividing 1950 by 144, or by its factors 12 and 12, as shown.

The area is found to be 13.542 sq. ft., to the nearest third decimal place.

Find the area of each of the following, carrying inexact results to the nearest third decimal place :

FIGURE	BASE	ALTITUDE	AREA
11. Rectangle	6 ft. 3 in.	4 ft. 7 in.	— sq. ft.
12. Rectangle	75 ft. $2\frac{1}{2}$ in.	32 ft. $4\frac{1}{2}$ in.	— sq. ft.
13. Triangle	44 ft. 1 in.	10 ft. 4 in.	— sq. ft.
14. Triangle	60 ft. 5 in.	33 ft. 11 in.	— sq. ft.
15. Square	18 ft. 6 in.	18 ft. 6 in.	— sq. ft.
16. Parallelogram	24 rd. 2 ft.	22 rd.	— sq. ft.

**17.** Find the volume, in cubic feet, of a rectangular solid whose dimensions are 24 ft. 7 in., 12 ft. 11 in., and 5 ft. 4 in.

**SUGGESTION.** — First find the volume in cubic inches. Then, since there are 1728 cu. in. in a cubic foot, divide the number of cubic inches by 1728, or by  $12 \times 12 \times 12$ .

Find the volume, in cubic feet, of the following solids :

	LENGTH	BREADTH	THICKNESS
<b>18.</b>	19 ft. 4 in.	12 ft. 7 in.	6 ft. 2 in.
<b>19.</b>	28 ft. $3\frac{1}{2}$ in.	20 ft. 4 in.	5 ft.
<b>20.</b>	52 ft. $7\frac{1}{2}$ in.	33 ft. 6 in.	5 ft. 10 in.

### Division

#### WRITTEN EXERCISES

**271. 1.** Divide 33 hr. 21 min. 45 sec. by 15.

				33 hr. $\div$ 15 = 2 hr. and 3 hr. remainder.
	hr.	min.	sec.	3 hr. 21 min. = 201 min.
15)	33	21	45	201 min. $\div$ 15 = 13 min. and 6 min. remainder.
	<u>2</u>	<u>13</u>	<u>27</u>	6 min. 45 sec. = 405 sec.
				405 sec. $\div$ 15 = 27 sec.

**2.** How many times is 2 hr. 13 min. 27 sec. contained in 33 hr. 21 min. 45 sec. ?

#### SOLUTION

Reducing the denominate numbers to a *common denomination*, as seconds,

$$2 \text{ hr. } 13 \text{ min. } 27 \text{ sec.} = 8007 \text{ sec.}$$

$$33 \text{ hr. } 21 \text{ min. } 45 \text{ sec.} = 120,105 \text{ sec.}$$

Dividing 120,105 sec. by 8007 sec., the quotient is 15.

Hence 2 hr. 13 min. 27 sec. is contained 15 times in 33 hr. 21 min. 45 sec.

**3.** How many times is 8 ft. 6 in. contained in 144 ft. 6 in. ?

#### SOLUTION

Reducing to a common denomination, in this case to feet,

$$8 \text{ ft. } 6 \text{ in.} = 8.5 \text{ ft. and } 144 \text{ ft. } 6 \text{ in.} = 144.5 \text{ ft.}$$

Dividing, the quotient is found to be 17.

Divide :

- ~~4.~~ 40 gal. 1 qt. by 7      ~~8.~~  $202^{\circ} 2'$  by 11  
 5. 81 lb. 9 oz. (av.) by 5      9. 8 T. 250 lb. by 25  
 6. 53 ft. 6 in. by 6      10. 102 mi. 120 rd. by 14  
 7. 92 yd. 27 in. by 9      11. 280 sq. ft. 120 sq. in. by 30  
 12. 49 lb. 8 oz. (av.) by 5 lb. 8 oz.  
 13. 239 ft. 7 in. by 9 ft. 7 in.  
 14.  $107^{\circ} 36' 6''$  by  $15^{\circ} 22' 18''$ .

15. If the circumference of an automobile wheel is 8 ft. 3 in., how many revolutions will the wheel make in going a mile?

17. If a horse eats  $1\frac{1}{2}$  pecks of oats per day, how long will  $31\frac{1}{2}$  bushels of oats last him?

18. How long will 30 hundredweight of oats last him, if a bushel of oats weighs 34 pounds?

19. The area of a rectangle is 47 sq. ft. 36 sq. in. and the base is 8 ft. 9 in. Find the altitude.

#### SOLUTION

$$47 \text{ sq. ft. } 36 \text{ sq. in.} = 47.25 \text{ sq. ft.}$$

$$8 \text{ ft. } 9 \text{ in.} = 8.75 \text{ ft.}$$

Since 47.25 is the product of the number of feet in the base and the number of feet in the altitude, and the base is 8.75 ft., the number of feet in the altitude is  $47.25 \div 8.75$ , or 5.4.

Hence, the altitude is 5.4 ft.

Find the missing dimension in each case :

20. Rectangle, area  $38\frac{1}{2}$  sq. ft., base  $8\frac{1}{2}$  ft.  
 21. Rectangle, area 1 acre, altitude  $10\frac{2}{3}$  rd.  
 22. Triangular lot, area 10 acres, base  $53\frac{1}{2}$  rd.

## WRITTEN EXERCISES

**278. 1.** Find 24% of \$47.25.

$$\begin{array}{r}
 \$47.25 \\
 .24 \\
 \hline
 18900 \\
 9450 \\
 \hline
 \$11.3400
 \end{array}$$

Since 24% of a number is .24 of it, 24% of \$47.25 is .24 of \$47.25.

Multiplying \$47.25 by .24, the result is \$11.34.

Hence 24% of \$47.25 = \$11.34.

Find to the nearest cent :

## WRITTEN EXERCISES

**279. 1.** Express decimally and as a common fraction in its lowest terms: 25 % ; 5 % ;  $33\frac{1}{3}$  % ; 125 % ;  $\frac{1}{2}$  %.

SOLUTIONS.

$$25\% = .25; \text{ also } 25\% = \frac{25}{100} = \frac{1}{4}.$$

$$5\% = .05; \text{ also } 5\% = \frac{5}{100} = \frac{1}{20}.$$

$$33\frac{1}{3}\% = .33\frac{1}{3}; \text{ also } 33\frac{1}{3}\% = \frac{33\frac{1}{3}}{100} = \frac{100}{300} = \frac{1}{3}.$$

$$125\% = 1.25; \text{ also } 125\% = \frac{125}{100} = \frac{5}{4}.$$

$$\frac{1}{2}\% = .00\frac{1}{2}; \text{ also } \frac{1}{2}\% = \frac{\frac{1}{2}}{100} = \frac{1}{200}.$$

It is seen that  $\frac{1}{2}\%$  means  $\frac{1}{2}$  of 1 %. What does  $\frac{1}{4}\%$  mean?  $\frac{3}{8}\%$ ?

Express decimally as hundredths:

34. To what per cent is  $\frac{3}{4}$  equivalent?  $\frac{2}{5}$ ?  $\frac{2}{3}$ ?  $1\frac{1}{5}$ ?

SOLUTIONS.

$$\frac{3}{4} = .75 = 75\%$$

$$\frac{2}{5} = .66\frac{2}{3} = 66\frac{2}{3}\%$$

$$\frac{1}{3} = .04 = 4\%$$

$$1\frac{1}{5} = 1.20 = 120\%$$

**280.** In many exercises, when the *per cent* has an easy *fractional equivalent*, the work can be shortened by using the fraction.

Thus, in finding  $33\frac{1}{3}\%$  of 36 it is much briefer and easier to do it by finding  $\frac{1}{3}$  of 36 than by multiplying 36 by  $.33\frac{1}{3}$ .

The following *table of equivalents* should be *memorized*, and applied whenever possible:

TABLE

$50\% = \frac{1}{2}$	$60\% = \frac{3}{5}$	$87\frac{1}{2}\% = \frac{7}{8}$
$25\% = \frac{1}{4}$	$80\% = \frac{4}{5}$	$33\frac{1}{3}\% = \frac{1}{3}$
$75\% = \frac{3}{4}$	$12\frac{1}{2}\% = \frac{1}{8}$	$66\frac{2}{3}\% = \frac{2}{3}$
$20\% = \frac{1}{5}$	$37\frac{1}{2}\% = \frac{3}{8}$	$16\frac{2}{3}\% = \frac{1}{6}$
$40\% = \frac{2}{5}$	$62\frac{1}{2}\% = \frac{5}{8}$	$83\frac{1}{3}\% = \frac{5}{6}$

282. 1. Find  $12\frac{1}{2}\%$  of \$275.20;  $\frac{1}{8}\%$  of \$275.20.

$$\begin{array}{r} 8)\$275.20 \\ \$34.40 \end{array}$$

$$\begin{array}{r} 8)\$2.7520 \\ \$ .3440 \end{array}$$

Since  $12\frac{1}{2}\% = \frac{1}{8}$ , the shortest way to find  $12\frac{1}{2}\%$  of \$275.20 is to find  $\frac{1}{8}$  of \$275.20, which is \$34.40.

Since  $\frac{1}{8}\%$  means  $\frac{1}{8}$  of 1%, we first find 1% of \$275.20 by moving the decimal point two places to the left,

Hence,  $12\frac{1}{2}\%$  of \$275.20 = \$34.40. and then find  $\frac{1}{8}$  of \$2.7520 = \$.344.

## WRITTEN EXERCISES

289. 1. Find the number of which 84 is 24%.

SOLUTION.  $24\%$  of the number = 84 ;  
that is,  $.24$  of the number = 84.  
Hence the number =  $84 \div .24 = 350$ .

2. Find the number of which 273 is  $87\frac{1}{2}\%$ .

SOLUTION. Since  $87\frac{1}{2}\% = \frac{7}{8}$ , 273 is  $\frac{7}{8}$  of the number.

Since  $\frac{7}{8}$  of the number = 273,

$\frac{1}{8}$  of the number =  $\frac{1}{7}$  of 273, or 39.

Hence, the number = 8 times 39, or 312.

Or, to shorten the work, the number =  $\frac{8}{7}$  of 273 = 312.

**290. Summary.**

You have learned how to find: a per cent of a number; what per cent one number is of another; and a number when a per cent of it is given.

**291.** The number of which a per cent is found is called the **base**.

**292.** The *number* of hundredths found is called the **rate**, or **rate per cent**.

**293.** The result obtained by finding a per cent of the base is called the **percentage**.

Thus, in 5 % of \$120 = \$6, \$120 is the *base*, 5 % is the *rate*, and \$6 is the *percentage*.

**294.** With the aid of these terms, we may now express in brief form the principles learned in the preceding pages:

*The percentage equals the base multiplied by the rate.*

*The rate equals the percentage divided by the base.*

*The base equals the percentage divided by the rate.*

**WRITTEN EXERCISES**

## Commercial Discount

**2.** If a manufacturer makes a deduction of 2% from his prices, for cash payment, what deduction for cash would he make on a bill of goods amounting to \$300?

**297.** Any deduction made from a fixed price or amount is called a **discount**.

**298.** Discounts are usually reckoned as some per cent of the price or amount. The per cent of discount is called the **rate of discount**.

**299.** Many articles of merchandise have fixed prices which are published in catalogues and price lists.

Such prices are known as **list prices**.

**300.** For various reasons, discounts are often given from the list price or the marked price and are frequently spoken of as so many "per cent off."

Thus, if an article listed or marked at \$1.50 is sold at "10% off," the discount is 10% of \$1.50, or \$.15, and the selling price \$1.50 - \$.15, or \$1.35.

## MEASURES AND EQUIVALENTS

## Measures of Weight

**305. Avoirdupois weight.**

The pound composed of 16 ounces, used in weighing bulky articles, is called an **avoirdupois pound**.

In delicate weighing, a small unit of weight called a **grain**, originally the weight of a grain of wheat, is used.

$$1 \text{ grain} = \frac{1}{7000} \text{ of an avoirdupois pound}$$

For complete tables of denominate numbers see pages 278-280.

**306. Troy weight.**

In weighing gold, silver, platinum, and some kinds of jewels, a weight equal to 5760 grains, or  $\frac{5760}{7000}$  of an avoirdupois pound, is used as a unit of weight.

This weight is called a **troy pound**.

$\frac{1}{12}$  of a troy pound, or 480 grains, is called a **troy ounce**.

$\frac{1}{20}$  of a troy ounce, or 24 grains, is called a **pennyweight**.

These related weights form the table of **troy weight**.

24 grains (gr.)	= 1 pennyweight, dwt.	
20 pennyweights	= 1 ounce,	oz.
12 ounces	= 1 pound,	lb.

In writing prescriptions physicians often use these units:

20 grains = 1 scruple

3 scruples = 1 dram

8 drams = 1 ounce (troy)

Except in filling prescriptions, druggists buy and sell by avoirdupois weight.

**309.** One fourth of a pint, liquid measure, is called a **gill**.

This measure is little used.

For the more common measures of volume and capacity, see the tables.

**310. Useful equivalents.**

A gallon is equivalent to 277.274 cu. in., and a bushel to 2218.192 cu. in. A gallon is thus slightly more than  $\frac{4}{5}$  of a cu. ft. and a bushel slightly more than  $1\frac{7}{8}$  cu. ft. In the following exercises (311) use these as working equivalents:

$$1 \text{ gallon} = \frac{4}{5} \text{ of a cu. ft.}; \text{ or } 6\frac{1}{4} \text{ gal.} = 1 \text{ cu. ft.}$$

$$1 \text{ bushel} = 1\frac{7}{8} \text{ cu. ft.}$$

**312.** Water in large quantities is measured by the barrel of  $31\frac{1}{2}$  gallons, by the cubic foot, and by the thousand or million gallons.

In all ordinary calculations the weight of a cubic foot of water is taken as  $62\frac{1}{2}$  lb. or 1000 oz., and of a gallon as 10 lb.

1 cu. ft. = 1728 cu. in. =  $2\frac{1}{7}\frac{2}{7}\frac{2}{7}\frac{1}{4}$  gal. =  $6.23^+$  gal., or  $6\frac{1}{4}$  gal. nearly.

Since 1 gallon of water weighs 10 pounds, and 1 cubic foot =  $6\frac{1}{4}$  gallons, the weight of 1 cubic foot of water =  $6\frac{1}{4}$  times 10 lb. =  $62\frac{1}{2}$  lb.

### Measures of Temperature

314. On a Fahrenheit (F.) thermometer, the one in common use in America, the freezing point of water is marked 32, for 32 *degrees*, and the boiling point 212. For ordinary purposes, however, thermometers are not marked as far as the boiling point.

Since the difference between the freezing and boiling points of water,  $212^{\circ} - 32^{\circ}$ , is  $180^{\circ}$ , one degree Fahrenheit is  $\frac{1}{180}$  of this difference.

Temperatures below  $0^{\circ}$  are written with a minus sign, thus:  $-1^{\circ}$ ,  $-2^{\circ}$ ,  $-10^{\circ}$ , etc.

## Lumber Measure

**317.** The number of board feet in a board 1 inch (or less) in thickness is the number of square feet of surface in one side of the board.

A board 1 foot wide and 15 feet long contains 15 square feet, or 15 feet board measure, if the board is 1 inch or less in thickness.

For brevity we often use the word "foot" instead of board foot, and "thousand feet" or M instead of thousand board feet.

**318.** When the thickness is greater than 1 inch, the number of feet board measure is obtained by multiplying the number of feet in length by the number of feet in width, and this product by the number of inches in thickness.

Thus, a board 6 ft. long and 10 in. wide contains  $6 \times \frac{5}{3}$  ft., or 5 ft., if it is 1 in. thick or less than 1 in. thick; if it is 2 in. thick, it contains  $2 \times 5$  ft., or 10 ft.; if  $1\frac{1}{2}$  in. thick,  $1\frac{1}{2} \times 5$  ft., or  $7\frac{1}{2}$  ft.

The dimensions 6 ft. by 10 in. by 2 in. are commonly written in this way:  $6' \times 10'' \times 2''$ .

# Plastering, Painting, and Kalsomining

**321.** Plastering, painting, and kalsomining are often computed by the square yard.

Laths are 4 feet long and are sold in bundles of 50 or 100.

A bundle of 100 laths will cover 5 square yards of wall.

In the following exercises 1 bundle means 100 laths.

A fractional part of a bundle cannot be bought.

## WRITTEN EXERCISES

### Roofing

**322.** An area of 100 square feet is called a **square**.

Common shingles are about 18 inches long and average 4 inches in width. When laid "4 inches to the weather," the exposed surface of 1 shingle is  $4 \times 4$  sq. in., or  $\frac{1}{9}$  sq. ft.

It takes 900 shingles, then, to cover 1 square, but to allow for waste 1000 shingles per square are often estimated.

## WRITTEN EXERCISES

**323. 1.** How many bunches of shingles, 250 shingles to the bunch, are required to shingle the roof of the barn shown on the preceding page, estimating 1000 shingles per square?

A fractional part of a bunch cannot be bought.

**6.** If 3 strips can be cut from each roll of sheathing paper, how much will the 24 strips of paper cost at 60 ¢ per roll?

**7.** Find the cost of the felt roofing at  $87\frac{1}{2}$  ¢ per roll, if each roll covers one square.

**8.** Find the whole cost of this cheaper roof, including:

48 lb. roofing nails @ 4 ¢

32 lb. roofing caps @  $4\frac{1}{2}$  ¢

1 bbl. roofing cement, 50 gal., @ 13 ¢

18 gal. roofing cement @ 15 ¢

Labor, \$11.20

**9.** Find the cost of the cheaper roof per square, to the nearest cent, the total cost being \$56.56.

### Papering and Carpeting

**324.** Wall paper is sold in single rolls 8 yards long, or in double rolls 16 yards long. It is usually 18 inches wide.

Fractional parts of a roll are not sold. In practice it is not always worth while, or even possible, to compute the exact cost of papering or carpeting rooms. What is sought is the approximate cost, making allowance for doors and windows, for matching patterns, etc.

#### EXERCISES

**5.** If the ceiling paper is put on the long way of the room, it will require 1 roll for each strip. How many rolls of ceiling paper would then be required?

Thus,  $18\frac{7}{10}\%$  may be written  $18.35\%$ , which means the same as  $.1835$ .

**331.** The rate is often given approximately to the nearest tenth or hundredth of 1 per cent, according to the degree of accuracy desired.

Thus, since  $\frac{1}{4} = .25$ ,  $5\frac{1}{4}\%$  (to the nearest tenth of 1%) is  $5.9\%$  and (to the nearest hundredth of 1%)  $5.93\%$ .

The decimal equivalents of these expressions are  $.059$  and  $.0593$ , respectively.

## Commercial Discount

**351.** To meet the varying conditions of the market, discounts are often given from the prices published in catalogues and price lists, the list prices usually being higher than market prices.

Sometimes, when goods are sold to be paid for at a future time, a discount is allowed for payment before that time.

It often happens that several successive discounts are allowed. The first is a discount from the list price, the second from the remainder, the third from the second remainder, and so on.

## WRITTEN EXERCISES

**352. 1.** Find the net price of an article listed at \$17.40, if the discounts are 25% and 20%.

List price	\$17.40
Less 25%	<u>4.35</u>
Remainder	13.05
Less 20%	<u>2.61</u>
Net price	\$10.44

The first discount is 25% of \$17.40, or \$4.35. Subtracting, we find the remainder, \$13.05. The second discount is 20% of \$13.05, or \$2.61. Subtracting, the net price is found to be \$10.44.

NOTE. — Find the discounts in the order (20%, 25%) and thus show that the result is the same in whatever order they are taken.

Find the net price of articles listed and discounted as follows:

- |                   |  |

| 2. \$25; 20%, 10% | 4. \$8.40; $33\frac{1}{3}\%$ , $12\frac{1}{2}\%$ |
| 3. \$40; 5%, 15%  | 5. \$5.70; 40%, $16\frac{2}{3}\%$                |

## Marking Goods

**356.** Merchants mark their goods to show the *cost* and the *selling price*, usually writing the first above a horizontal line and the second below.

To prevent customers from reading the mark and discovering the gain, some private mark is usually adopted.

The most usual device employed is some word or words of ten different letters to represent the ten Arabic numerals.

This is called a **key**.

Thus, if the key is "White Sambo," the corresponding letters and figures are

w	h	i	t	e	s	a	m	b	o
1	2	3	4	5	6	7	8	9	0

**357.** To avoid repeating a letter and thus giving a clew to the key, an extra letter, called a **repeater**, is used.

Thus, if the cost of an article is \$1.75 and the selling price \$2.99, using the key "White Sambo" with *k* for the repeater, the mark would be  $\frac{\text{wae}}{\text{hbk}}$ .

In the exercises, use this key and repeater unless otherwise specified.

## WRITTEN EXERCISES

**358.** Interpret the following and find the per cent of gain for each:

- |                                    |                                   |                                  |                                    |                                       |

In the following fill in the selling price at  $33\frac{1}{3}\%$  above cost:

- |                               |                                |                                |                                |                                 |

Fill in the cost mark in each of the following, the given selling price being 20 % above cost :

21.  $\frac{\dots}{tm}$

23.  $\frac{\dots}{iok}$

25.  $\frac{\dots}{mt}$

27.  $\frac{\dots}{ith}$

29.  $\frac{\dots}{is}$

22.  $\frac{\dots}{sk}$

24.  $\frac{\dots}{aao}$

26.  $\frac{\dots}{bs}$

28.  $\frac{\dots}{tbn}$

30.  $\frac{\dots}{smts}$

Mark articles to sell at  $37\frac{1}{2}$  % above the following costs :

31. 24 ¢

33. 88 ¢

35. \$2.80

37. \$4.48

39. \$176

32. 40 ¢

34. 96 ¢

36. \$7.20

38. \$6.80

40. \$224

41. How shall a book dealer mark a book that cost \$1.20 so that he may give a discount of 16 % from the marked price and still make a profit of 40 % ?

SOLUTION. 140 % of \$1.20 = \$1.68, selling price.

Since the selling price is 16 % less than the marked price, \$1.68 is 84 % of the marked price.

Then the marked price =  $\$1.68 \div .84 = \$2$ .

Hence the complete mark should be  $\frac{who}{hok}$ .

Mark articles that cost as follows so that there will be a profit of 25 % after giving the indicated discount :

42. 32 ¢, discount 20 %

45. \$3.40, discount 15 %

43. 72 ¢, discount 10 %

46. \$6.72, discount  $12\frac{1}{2}$  %

44. \$48, discount 25 %

47. \$8.40, discount  $16\frac{2}{3}$  %

Find the cost of one article when billed by the dozen as follows, and give complete marks (profit 40 %), using the key "birthplace," repeater  $n$ , for the cost, and "White Sambo," repeater  $k$ , for the selling price :

48. Hats, \$21

52. Shirts, \$18

49. Caps, \$15.60

53. Gloves, \$16.80

50. Scarfs, \$24

54. Shoes, \$30

51. Neckties, \$7.20

55. Rubbers, \$8.40

## INTEREST

**359.** 1. I hired a bicycle at 20 ¢ an hour. If I returned it at the end of 2 hours, how much did I pay for its use?

2. I rented Mr. Ward's house at \$25 a month. How much did I pay for the use of the house for a year?

If this house was worth \$3000, what per cent of its value did I pay for using it a year?

3. I used \$400 of another man's money for one year. When I returned the money, I also paid him a sum equal to 6 % of it.

## WRITTEN EXERCISES

**365.** 1. What is the interest on \$94.65 for 3 years at 6%?

SOLUTION.—\$94.65, principal

.06, rate

\$5.6790, interest for 1 year

3

\$17.037, interest for 3 years

Hence the interest on \$94.65 for 3 years at 6% is \$17.04.

NOTE.—In computing interest, it is sufficiently accurate to express final results to the nearest cent and intermediate results to the nearest mill.

*The interest equals the principal multiplied by the rate multiplied by the number expressing the time in years.*

Find the interest on:

- |                            |  |

**366. Interest for years and months.**

1. What part of a year is 6 months? 4 months? 3 months? 2 months?

2. What is the interest on \$200 at 6% for 1 year? What part of the interest for 1 year is the interest for 6 months? for 4 months? for 3 months? for 2 months?

Then what is the interest on \$200 at 6% for 6 months? for 4 months? for 3 months? for 2 months?

3. At 5% what is the interest on \$300 for 1 year? for 4 months? for 1 yr. 4 mo.?

4. Find the interest on \$400 at 4% for 1 year; for 2 yr.; for 3 mo.; for 2 yr. 3 mo.; for 3 yr. 6 mo.

5. At 3% what is the interest on \$800 for 1 yr. 4 mo.?

*In ordinary business calculations where strict accuracy is not required, it is customary in computing interest for months to regard a month as  $\frac{1}{12}$  of a year, 3 months as  $\frac{1}{4}$  of a year, etc.*

## ACCURATE INTEREST

**369.** Interest computed by taking the exact number of days between dates and reckoning 365 days for a year is called **accurate** or **exact interest**. Whole years are reckoned as years simply, and for parts of a year the exact number of days is counted, and each day is regarded as  $\frac{1}{365}$  of a year.

This method is always employed by Canadian banks and usually by other financial institutions.

Find the exact interest and the amount of \$219 on interest from July 9, 1906, to Aug. 13, 1907, @ 8%.

TIME: July 9, 1906, to July 9, 1907 = 1 year.

Number of days from July 9 to Aug. 13:

JULY	AUG.	TOTAL
31 da. - 9 da. = 22 da.	+ 13 da. = 35 da.	= $\frac{35}{365}$ yr. = $\frac{7}{73}$ yr.
Interest is for $1\frac{7}{73}$ yr.		

Note that the first day (July 9) is not counted, and the last day (Aug. 13) is. For further steps in solution see p. 262.

When crops are sold off a farm year after year, the soil becomes impoverished. As farm animals are good agents for restoring fertility to the soil, farmers find it profitable to feed part of their crop to cattle during the winter, producing "stall-fed" beef.

**122.** How many cars holding 48 tons of ore each are there in a train, if the whole amount of ore is 1776 tons?

**123.** If a car of 50 (short) tons capacity is loaded with 48 long tons of iron ore, how many pounds will it be loaded beyond its regular carrying capacity? (See p. 279.)

**124.** A bucket worked by machinery will unload 10 tons of ore at a time from a ship. A ton of ore occupies about 17 cubic feet of space. If the unloading machine is used 8 hours per day and takes two bucketfuls per minute, how many cubic feet of ore will it transfer in 6 days?

**125.** A coal-loading machine transferred 12 car loads of coal, 50 tons to the car, into the hold of a vessel at a certain port, in 45 minutes. How many tons of coal were transferred per hour?

## TABLES OF DENOMINATE NUMBERS

## Measures of Length

12 inches = 1 foot

3 feet = 1 yard

 $16\frac{1}{2}$  feet = 1 rod

320 rods = 1 mile

1 mi. = 320 rd. = 1760 yd. = 5280 ft. = 63,360 in.

## Measures of Surface

144 square inches = 1 square foot

9 square feet = 1 square yard

 $30\frac{1}{4}$  square yards = 1 square rod

160 square rods = 1 acre

640 acres = 1 square mile

100 square feet of *roofing* is called a **square**.A square mile of *land* is often called a **section**.

## Measures of Volume

1728 cubic inches = 1 cubic foot

 $2\frac{1}{2}$  cubic feet = 1 cubic yardA pile of *wood* 8 ft. long, 4 ft. wide, and 4 ft. high is called a **cord**.

## Measures of Capacity

4 gills = 1 pint

2 pints = 1 quart

4 quarts = 1 gallon

2 gallons = 1 peck

4 pecks = 1 bushel

A gallon is equal to 277.274 cu. in., or about  $277\frac{1}{4}$  cu. in.

A gallon of water weighs 10 lb.

A cubic foot of water weighs  $62\frac{1}{2}$  lb., or 1000 oz.

A bushel is equal to 2218.19 cubic inches, or approximately  $1\frac{2}{3}$  cubic feet.

### Avoirdupois Weight

16 ounces = 1 pound

100 pounds = 1 hundredweight

2000 pounds = 20 hundredweight = 1 ton

A long ton contains 2240 pounds. An avoirdupois pound contains 7000 grains.

A barrel of flour weighs 196 pounds, and a bushel of wheat 60 pounds.

### Troy Weight

24 grains = 1 pennyweight

20 pennyweights = 1 ounce

12 ounces = 1 pound

A troy pound contains 5760 grains.

### Measures of Time

60 seconds = 1 minute

60 minutes = 1 hour

24 hours = 1 day

7 days = 1 week

365 days = 1 year

366 days = 1 leap year

10 years = 1 decade

100 years = 1 century

Thirty days have September,  
April, June, and November.

All the rest have thirty-one,  
Save February, which alone  
Has twenty-eight, and one day more  
We add to it one year in four.

Centennial years exactly divisible by 400 and other years exactly divisible by 4 are leap years.

**Measures of Angles and Arcs**

60 seconds = 1 minute

60 minutes = 1 degree

360 degrees = 4 right angles, or 1 circumference

90° of angle is a right angle; 90° of arc is a quadrant.

**Counting Table**

2 = 1 pair

20 = 1 score

12 = 1 dozen

12 dozen = 1 gross

12 gross = 1 great gross

**Stationers' Measures**

24 sheets = 1 quire

20 quires = 1 ream

Paper is quite generally sold by the 100, 500, and 1000 sheets; also by the pound.

**Canadian Money**

10 mills = 1 cent

100 cents = 1 dollar

Although mills are not coined, tenths of a cent are often read as mills.
